Abstract A new species belonging to subfamily Ctenopelmatinae of family Ichneumonidae, *Dentimachus guanshanicus* sp. nov. collected from Jiangxi Province, is described. A key to the species of *Dentimachus* known in China is provided. Holotype of the new species are deposited in the General Station of Forest Pest Management, State Forestry Administration, Shenyang, China.

## Dentimachus guanshanicus sp. nov. (Figs 1 – 3)

The new species is similar to *D. henanicus* Sheng, 2009 but can be distinguished from latter in having face, mesopleuron with distinct punctures; propodeum with distinct median longitudinal carina; tergum 2 about 0.6 times as long as its apical width; face black, lower portion with large "U" -shaped yellow fleck. *D. henanicus* Sheng: face with fine granulose texture,

very weak and unclear punctures; propodeum without median longitudinal carina; tergum 2 about 0.9 times as long as its apical width; face entirely yellow.
